## Multiple Representations of Linear Functions

Stardollars Coffee hosted a coffee-cup-stacking contest. Anthony noticed a pattern. He told the judges that Figure 100 would have 203 coffee cups stacked up. Was he correct? Use mathematics to prove or disprove Anthony's claim.

- Include a **table**, a **graph**, and a **rule** (equation) in your solution.
- Justify your solution.
- You need to explain how the **table**, **graph**, **rule**, and the **figures** prove or disprove Anthony's claim in your justification.

Figures	Coffee cups
0	3
1	5
2	7
3	9
↓	↓
100	203

$$y = 2x + 3$$

$$y = 2(100) + 3$$

$$200 + 3$$

$$203$$

cc - coffee cups

Anthony was correct in his claim that by figure 100 he would have 203 coffee cups. He was right because in figure 1 there were 3 cc's and in figure 2 there were 5 cc's, etc. If this pattern continues increasing by 2 each time by the 100<sup>th</sup> figure you would have 203 cc's. I know this because I plugged 100 as x into my equation and got a result of 203. Looking at my graph you notice that up every dot there are 2 blocks in between, this also tells me that the pattern increases by 2. In my table you subtract 2 each time and eventually end up with 203. My table, graph, and my equation all show me my Anthony's claim.

Figure 2

Figure 3

Figure	Cups
0	1
1	3
2	5
3	7
4	9
5	11
6	13
10	21
20	41
30	61
40	81
50	101
60	121
70	141
80	161
90	181
100	201

$$y = 2x + 1$$

He was incorrect. By every 5 figures you would have added 10. And by the time you get to figure 100, you would have 201 coffee cups. Not 203. It was pretty close though.

4	9

③

rule: adding by 2  
and it is linear.  
cause it was going  
up so it is positive.

④

He is right because if you keep on  
adding 2 each time until you  
get to 100 then you will get  
203.

Arithmetic, +2

$$t(0) = 0$$

$$t(1) = 3$$

$$t(1+1) = 5$$

$$t(n) = n + 2$$

$$t(100) = n + 2$$

$$= 102$$

Anthony was wrong. There will be 102 cups
